Functional & Performance Testing Template

GenAI / Flow Designer Project Testing

Date	01 October 2026
Team ID	SWTID-2026-2670
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Technology	ServiceNow Flow Designer
Project Type	IT Procurement Workflow Automation

Test Scenarios & Results

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
FT-01	Standard Laptop Request Validation	Submit a laptop request with all required details such as requester, laptop type, quantity and justification.	Valid request is accepted and the Flow Designer flow is triggered.		
FT-02	Required Field Validation	Submit a request with one or more required fields left blank.	Request is rejected or held for correction according to the configured validation.		
FT-03	Standard Laptop Criteria Check	Submit a request that matches the predefined standard laptop criteria.	Flow identifies the request as a standard laptop order and follows the automated path.		
FT-04	Approval Flow Check	Submit a request that requires approval and complete the approval step.	Approval is generated and the flow continues after approval.		

FT-05	Procurement Task Creation	Complete a valid approved laptop request and inspect the resulting tasks.	Procurement/fulfillment task is created with the correct request information.		
FT-06	Rejected Request Handling	Submit a request and reject it during the approval stage.	Flow follows the rejection path and updates/notifies the requester.		
FT-07	Requester Notification	Run a valid request through the flow and check notifications.	Requester receives the configured status/fulfillment notification.		
FT-08	Flow Execution Check	Execute the complete standard laptop order process from request to fulfillment task.	All configured flow actions execute in the correct sequence without errors.		

Performance Testing

Test Case ID	Scenario (What to test)	Test Steps (How to test)	Expected Result	Actual Result	Pass/Fail
PT-01	Flow Response Time Test	Start a standard laptop request and measure the time taken for the flow to trigger and begin processing.	Flow should start within the acceptable response time configured for the ServiceNow environment.		
PT-02	Multiple Request Load Test	Submit multiple standard laptop	Requests should be processed without		

		requests within a short period.	significant delay, failure, or incorrect task creation.		
PT-03	Concurrent Approval Test	Create multiple requests requiring approval and process approvals concurrently.	Approval and downstream flow actions should remain responsive and correctly associated with each request.		
PT-04	Flow Execution Stability Test	Run repeated standard laptop orders through the complete flow.	Flow should execute consistently without crashes, duplicate tasks, or missed notifications.		
PT-05	Notification Performance Test	Process multiple requests and monitor notification generation.	Notifications should be generated correctly without excessive delay or duplication.		

Note: The uploaded source template contains generic GenAI functional and performance scenarios. For this project, they have been adapted to test the ServiceNow Flow Designer workflow for standard laptop procurement. Actual Result and Pass/Fail fields should be completed after executing the tests.
