SALESFORCE PROJECT TEMPLATE

Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer

Project Development Phase | Model Performance Testing

Field	Project Details
Date	01 October 2026
Team ID	SWTID-2026-2670
Project Name	Streamlining IT Procurement: Automating Standard Laptop Orders with Flow Designer
Platform	Salesforce Flow Builder / Flow Designer
Project Owner	[Name / team]
Maximum Marks	[Enter if applicable]

1. Project Overview

This project automates the standard laptop procurement process in Salesforce. When an eligible laptop request is submitted, the flow validates the request, determines the standard device configuration, routes approvals when required, creates or updates procurement records, and notifies the requester and IT procurement team.

2. Business Objective

- Reduce manual entry and processing time for standard laptop requests.
- Apply consistent device, cost-center, approval, and fulfillment rules.
- Improve request visibility through Salesforce records, reports, and notifications.
- Prevent incomplete or invalid orders from reaching procurement.

3. Scope and Assumptions

In scope	Out of scope
Standard laptop orders for eligible employees	Non-standard or custom hardware bundles
Request validation and approval routing	Vendor contract negotiation
Procurement record creation and notifications	Physical device imaging and deployment
Status tracking and reporting	Changes to external ERP unless integrated

4. Salesforce Data Model

Object / Record	Purpose	Key Fields
Laptop Request (custom object)	Captures employee procurement request	Requester, start date, department, location, laptop tier, quantity, cost center, status
Laptop Catalog (custom object)	Stores approved standard configurations	Tier, model, specifications, unit price, active, region
Approval / Procurement Order	Tracks approval and fulfillment	Request, approver, approval status, purchase order, vendor, fulfillment status
User / Employee	Provides requester and manager data	Name, department, manager, location, employment status

5. Flow Design

Step	Flow Element	Configuration / Expected Result
1	Trigger	Record-triggered flow when Laptop Request is created or submitted.
2	Get Records	Retrieve requester, manager, catalog item, and applicable policy data.
3	Decision: Eligibility	Confirm employee is active, request is for a standard tier, and required fields are complete.
4	Decision: Approval Needed	Route based on total cost, department, location, or exception flags.
5	Assignment	Calculate total cost = quantity × unit price and set initial status.
6	Create Records	Create procurement order / approval record when validation succeeds.
7	Notification	Send confirmation to requester and task/alert to procurement or approver.
8	Update Records	Set status to Approved, Rejected, Ordered, Fulfilled, or Exception.
9	Fault Path	Log error details and notify support without creating a duplicate order.

6. Business Rules

Rule ID	Rule	Expected Outcome
BR-01	Requester must be an active employee.	Reject or flag inactive requester.
BR-02	Laptop tier must be active in the approved catalog.	Prevent submission if no valid catalog match exists.
BR-03	Quantity must be a positive whole number.	Display validation error.
BR-04	Cost center and delivery location are required.	Do not create procurement order until complete.
BR-05	Orders above [amount] require manager / finance approval.	Create approval request and set status to Pending Approval.
BR-06	Non-standard requirements must not follow the standard-order path.	Set status to Exception and notify IT procurement.
BR-07	Flow must be idempotent.	Do not create duplicate procurement orders for the same request.

7. Model Performance Testing

Project team shall complete the following validation evidence after configuration and deployment.

S.No.	Parameter	Values / Evidence	Screenshot / Link
1	Automation Summary	Flow name: [Enter]. Trigger: [Enter]. Objects: [Enter]. Outcome: [Enter].	[Attach screenshot]
2	Functional Accuracy	Successful standard orders: [x]/[n] = [x%]. Invalid requests blocked: [x]/[n] = [x%]. Duplicate	[Attach test results]

		orders: [x].	
3	Validation Coverage	Required fields, inactive users, invalid catalog item, approval threshold, exception path, and fault path tested.	[Attach screenshots]
4	Performance	Average flow completion time: [x] seconds. Bulk test volume: [x] records. Errors: [x].	[Attach debug logs]
5	Notifications	Requester confirmation, approver alert, procurement alert, rejection, and fault notification verified.	[Attach screenshots]
6	Reporting	Open requests, pending approvals, orders by status, cycle time, and exceptions report verified.	[Attach report screenshots]

8. Test Cases

Test ID	Scenario	Input / Condition	Expected Result	Actual Result / Status
TC-01	Valid standard order	Active employee; valid tier; quantity 1	Request and procurement record created	[Enter]
TC-02	Missing required field	No cost center or location	Submission blocked with clear error	[Enter]
TC-03	Approval threshold	Total cost above threshold	Approval record created; order not released	[Enter]
TC-04	Below threshold	Total cost below threshold	Order proceeds according to policy	[Enter]
TC-05	Invalid catalog item	Inactive or missing tier	Request routed to exception path	[Enter]
TC-06	Duplicate prevention	Flow retriggered for same request	No duplicate order created	[Enter]
TC-07	Fault handling	Simulated create/update failure	Error logged and support notified	[Enter]
TC-08	Bulk submission	[Enter] requests in one batch	All records processed within target; no unhandled failures	[Enter]

9. Success Metrics

Metric	Baseline	Target	Measured Result
Average request processing time	[Enter]	Reduce by [x]%	[Enter]
Manual procurement touches per order	[Enter]	[Enter] or fewer	[Enter]
First-pass validation success	[Enter]	≥ [x]%	[Enter]
Duplicate / invalid orders	[Enter]	0	[Enter]
Requester notification timeliness	[Enter]	Within [x] minutes	[Enter]

10. Risks and Controls

Risk	Control / Mitigation
Incorrect catalog pricing	Use an active catalog with effective dates and an owner review process.
Duplicate flow execution	Use a unique request key and check for existing procurement order before creation.
Approval delays	Escalation reminders and dashboard for pending approvals.
Integration or automation failure	Fault paths, error logging, alerts, and retry procedure.
Sensitive employee data exposure	Apply field-level security, sharing rules, and least-privilege access.

11. Deployment Checklist

- Confirm custom objects, fields, picklists, validation rules, and permissions.
- Activate the flow only after sandbox test cases pass.
- Configure email alerts, custom notifications, queues, and approval assignments.
- Verify reports and dashboards with representative data.
- Document rollback steps and flow version to deactivate if needed.
- Obtain business owner and IT procurement sign-off.

12. Sign-off

Role	Name	Signature	Date
Project Owner	[Enter]	[Enter]	[Enter]
IT Procurement Owner	[Enter]	[Enter]	[Enter]
Salesforce Administrator	[Enter]	[Enter]	[Enter]
Business Approver	[Enter]	[Enter]	[Enter]

Note: Replace bracketed placeholders with project-specific values and attach Salesforce Flow Builder screenshots, debug logs, test evidence, and report links before submission.
